## 5.3 Other Parameters

### 5.3.1 Geo-location capability

#### 5.3.1.1 Requirements

The geographical location determined by the equipment as defined in following section (5.3.1.2) shall not be accessible to the user.

#### 5.3.1.2 Definition

Geo-location capability is a feature of the equipment to determine its geographical location with the purpose to

configure itself according to the regulatory requirements applicable at the geographical location where it operates.

The geo-location capability may be present in the equipment or in an external device (temporary) associated with the equipment operating at the same geographical location during the initial power up of the equipment. The geographical location may also be available in equipment already installed and operating at the same geographical location.

## A.11 Receiver Spurious Emissions

Note<sup>1</sup>: The test method choose the conducted method. Which power in a specified load (conducted spurious emissions) and their effective radiated power when radiated by the cabinet or structure of the equipment (cabinet radiation).

Note<sup>2</sup>: The Frequency band was pre-scanned, the harmonic and other spurious which worst frequency are recorded in the report.

Note<sup>3</sup>: The cabinet radiated test data is tested in the normal working mode of the product.

## A.12 Receiver Blocking

### For Bluetooth Low Energy

Note 1: The combination of the smallest channel bandwidth and the lowest data rate was reported.

Note 2: Blocking signal levels specified are levels in front of the UUT antenna. In case of conducted measurements, the levels corrected by the actual antenna assembly gain.

Note 3: During the Blocking test, the number of packets sent by the system is 1500
